

**GreenHaven Community website report**

**PHAM GIA HOANG**

**GCS240346**

**DAY OF SUBMISSION: 15/4/2026**

## **Part 1. Introduction**

This report is made to discuss the process of design and development of the GreenHaven Community website. The website was created in return of the coursework brief that was given and the purpose is to build a website for a community organisation with the aim of being able to inform visitors about what they do. A fictional community is selected for this website but is realistic and appropriate for this project.

GreenHaven is portrayed as a sustainability-focused community garden that promotes shared gardening, workshops, volunteering and educational activities. The website is designed with the purpose of advocating a welcoming, friendly and community-driven environment. Through the interface, visitors should be able to understand the purpose of the website and its services alongside ways to reach out to the garden.

There are six linked pages to the website: Home, About, Programmes, Events, Gallery and Contacts, this gives the site a fully structured interface for an organisational website. Additionally, a navigation bar on the top of the website is included for navigating easily around the web portal and one footer design was used for a consistent design around the web regardless of varied designs around the web.

A client-side interactive module is also made using JavaScript. This includes a mobile navigation menu, dark mode, scrolling animations, gallery filter, animated statistics and a contact form fill-out. These features are extended features for improving user experience and modernise the website while keeping everything consistent throughout.

This report will be used to explain all the phases of development for this website from planning, organisation concept, design decisions, technical features, accessibility, testing and reflection. Code segments are also included to explain how the design and functionality were implemented.

## **Part 2. Project interpretation**

In the brief, multiple pages are required for the website of the organisation. It is interpreted into a clear set of development targets.

Firstly, the website needs to have a minimum of five pages. Secondly, it needs to represent a community organisation and show what the organisation does. Furthermore, visitors need to know about how to contact them and the website needs to be encouraging for them to be participating in the events and it has to include pages about themselves, their services and programmes, events and news and their contact information. Not only that, the website needs to

be designed uniformly (same design language) but can vary in places and it needs to have images where appropriate and no offensive language or content.

Based on these points of the brief, the website is built upon those requirements. The visitor needs to be able to understand the purpose of the website within a short amount of time and they should be able to navigate through the website easily and look for the information that they need quickly and should be encouraged to join, attend activities and reach out to the organisers without any difficulty, therefore shaping the system based on the requirements of the project brief.

## **Part 3. Organisation concept**

### **3.1 Organisation profile**

GreenHaven Community Garden is a local organisation built around gardening, sustainability and community participation. The concept of the organisation is that it can be more than just a garden, it can be a place for connections. From social to educational, this place can be where people learn, connect and contribute something positive to the place.

On the web, visitors can sign up for:

- Growing food on shared plots
- Attending gathering workshops
- Volunteering
- Be a part of seasonal events
- Learn more about sustainability

This concept works fairly well for the requirements of the project due to its ability to support a wide range of community events.

### **3.2 Target audience**

The target audience for the website are as follow:

- Local residents
- Families
- People who are interested in gardening
- Volunteers
- Sustainability believers
- Schools or community groups

There are different levels of digital experience, the site is made with ease-of-use in mind and everything is consistently straightforward with the use of short paragraphs for descriptions, bold headings and easy navigation so that it can suit a wide range of audience.

### **3.3 User needs**

For visitors, they need to be able to understand what does GreenHaven do, therefore the needs are identified as follows:

- Understanding the purpose and mission of GreenHaven
- Get to know what activities do they have
- Finding event information
- Proof that the organisation is still active
- Contact information of the organisation

Given those identified needs, the site is designed with those needs in mind.

## **Part 4. Website structure**

As seen above, the website has six main pages: Home, About, Programmes, Events, Gallery and Contacts. The structure of these pages will now be analysed down below.

### **4.1 Home page**

The Home page will introduce a brief about what GreenHaven is, followed with a quick overview of what they do. It includes a hero section (a section that is prominent and large and positioned right underneath the header), programme highlights, statistics, testimonials and action buttons. This page is an introduction to what the organisation is and helps direct visitors to different parts of the website.

### **4.2 About page**

This page will explain the organisation's background, values and their operation team. The purpose of this page is to give the user a better depth about the organisation and build the trust between the organisation and visitors if they decide to participate in the organisation's programmes.

### **4.3 Programmes page**

This page explains all the main programmes that GreenHaven is hosting. The activities include community plots, gardening workshops, kids' club, composting and volunteering programme and a harvest sharing scheme.

#### **4.4 Events page**

This page shows the community's upcoming and past events. This provides the proof of operational for the community and gives out the sense of activity.

#### **4.5 Gallery page**

This page displays photos of the garden, workshops, people and harvests (AI-generated photos). This makes the website feel more engaging, visualising the community using photos to make the website feels more real.

#### **4.6 Contact page**

This page gives the visitors a contact form to fill out any of their questions with their contact information. This page also contains the community's opening hours, address, phone number and email address, therefore making it easier for visitors to get in touch with the community.

In conclusion, these pages give the website the overall completeness and covers all the requirements in the brief.

### **5. Design choices**

The community's theme is about gardening and sustainability, therefore the main color theme for the website revolves around shades of green, reflecting the theme of the community. Green is the color that is usually connected to plants and community wellbeing. Additionally, soft cream white and neutral backgrounds are used to combine with shades of green, making the site clean and easy to read.

Furthermore, this design is aimed to feel welcoming and playful, not formality. Organisations like this typically benefit from a friendly and approachable style, therefore gentle colors are selected, rounded card layouts and clear action buttons are also used for ease-of-use. This makes the site easy to use, have less clutter and contents are displayed clearly.

For unifying the design language, certain design elements are reused through out:

- Navigation bar
- Footer

- Header
- Spacing
- Button designs

Even though one design language is followed, page layouts are made so that one design language is maintained but with some variations, avoiding one boring layout. Changes are as follows:

- The Home page has a large hero section, containing grouped cards.
- The About page uses image and text split layout
- The Programmes page uses a larger number of cards in the page
- The Events page uses date-based event blocks
- The Gallery page has image filtering and overlays are used
- The Contact page uses a two-column layout

This ensures that the web uses one unified design language but with a variation in design for different purposes.

## **6. Content**

The requirement for the content is to be able to inform visitors and encourage them to take action. The content for GreenHaven is made to give visitors the organisation's purpose, services, team, events and contact details. This shows what GreenHaven is and what they do, making sure visitors can understand them and their operation as an organisation.

There are content parts that are persuasive towards the visitors are shown in these segments:

- "Explore programmes" button
- "Get in touch" button
- Testimonials
- Membership prompts
- Event descriptions

A friendly and clear tone in writing is used throughout the site. It is simple and direct, making it easier for users to understand. The pages are also divided into clear sections so that information is not too dense, therefore making information separate from each other. The information is meant to be a guide for visitors throughout the website, not only descriptive about what the organisation has and does.

## **7. Media and Visual**

Images are used throughout the website to strengthen the theme and improve engagement. The images are AI-generated, but it shows:

- The garden space
- Workshop environment
- Children gardening for the kids' club
- Composting activities
- Fresh production and harvest

These images help the visitor understand what GreenHaven looks like in practice because visual evidence can build trust towards visitors, making the site feel more authentic.

The media-focused Gallery page consists of all the images that were used on the site. It contains different images and brings them together in one place and it has the filter feature so that visitors can filter the images based on categories. The lightbox feature is used when the visitor clicks on an image, allowing the user to primarily focus on the details of the picture and temporarily dim out the rest of the page.

The Contact page contains contact information so that visitors can get in touch with the community, it has a map segment implemented into the website. Although this is just a general map segment, it gives the website the authenticity of a real “Contact” page where visitors would be able to check the address of a place out if they need to, making this a practical form of media.

The site mainly focuses on images and doesn't have any forms of video as media because images alone fits the project scope and suits the organisation in the best way possible. It is used relevantly, purposefully and consistent with the organisation's theme.

## **8. Technical implementation**

The website is made using HTML, CSS and JavaScript. HTML was used for the structure of the page, while CSS is used for the site's styling and layout and JavaScript for interactive features of the web.

Semantic elements are used for HTML for clear and straightforward display of content, including headings, sections, forms, navigation and footer elements. Semantic markup helps with accessibility and makes the site easy to maintain.

CSS handles the visual side of the site, including layouts, spacing, typography, colours and responsive behaviour of the site. Reusable classes are used for buttons, cards, grids and sections, therefore making the site's design stay consistent across pages and throughout the site.

JavaScript are used to add the following features:

- Mobile menu
- Dark mode toggle (with saved preference)
- Fade animations triggered through scrolling
- Animated statistics
- Gallery filtering
- Lightbox viewing for photos in gallery
- Contact form validation
- Smooth scrolling support

These added features make the website more fluid and improves the user experience without overcomplexifying it and eliminating static content display problems. Code snippets are included below for analysis.

### Snippet 1: Shared navigation structure

```
<nav class="navbar" aria-label="Main navigation">
  <div class="container">
    <a href="index.html" class="nav-logo" aria-label="GreenHaven Home">
      <span class="nav-logo-icon"> </span>
      Green<span>Haven</span>
    </a>
    <div class="nav-links" id="nav-links">
      <a href="index.html" class="active">Home</a>
      <a href="about.html">About</a>
      <a href="programmes.html">Programmes</a>
      <a href="events.html">Events</a>
      <a href="gallery.html">Gallery</a>
      <a href="contact.html">Contact</a>
      <button class="theme-toggle" aria-label="Toggle dark mode"> </button>
    </div>
  </div>
</nav>
```

This snippet supports consistency across the site by reusing the same code across , giving visitors a clear path to different pages right in the main page.

### Snippet 2: CSS setup

```
:root {
```

```
--clr-primary: #2d6a4f;
--clr-primary-light: #40916c;
--clr-primary-dark: #1b4332;
--font-heading: 'Outfit', sans-serif;
--font-body: 'Inter', sans-serif;
}
```

This stylesheet uses CSS custom properties to manage custom colour palettes and fonts. This approach makes the design reusable throughout the whole website and easier to control.

### Snippet 3: Dark mode

```
const themeToggle = document.querySelector('.theme-toggle');

if (themeToggle) {
  themeToggle.addEventListener('click', function () {
    var currentTheme = document.documentElement.getAttribute('data-theme');
    var newTheme = currentTheme === 'dark' ? 'light' : 'dark';
    document.documentElement.setAttribute('data-theme', newTheme);
    localStorage.setItem('greenhaven-theme', newTheme);
    updateThemeIcon(newTheme);
  });
}
```

This feature is written using JavaScript to allow users to switch between light and dark mode. This improves usability for the site by giving users the choice to change the theme to their preference and save it for later visits.

### Snippet 4: Lightbox viewing for gallery

```
galleryItems.forEach(function (item) {
  item.addEventListener('click', function () {
    var img = item.querySelector('img');
    var caption = item.getAttribute('data-caption') || img.alt || "";

    if (lightbox && lightboxImg) {
      lightboxImg.src = img.src;
      lightboxImg.alt = caption;
      if (lightboxCaption) {
        lightboxCaption.textContent = caption;
      }
    }
  });
});
```

```
    }  
    lightbox.classList.add('active');  
    document.body.style.overflow = 'hidden';  
  }  
});  
});
```

By adding this feature, it makes the gallery more interactive and focuses on the image to make it as a part of the site's storytelling for the organisation.

### **Snippet 5: Contact form validation**

```
var emailPattern = /^[^\s@]+@[^\s@]+\.[^\s@]+$/;
```

This line checks for valid information before allowing submission by making sure that the email addresses are in a valid format, improving the reliability of the forms and eliminating mistakes in the form.

## **9. Accessibility and usability**

Accessibility is one of the top priorities when designing the website. For accessibility features, every images comes with an alternative text (aka description) and it is shown in this code segment here:

```

```

Clear labels are also present on the contact form fields so that visitors know where to type in what information. Headings are used in places where they are needed and content is broken up into sections, rather than everything being included in one giant text box. This ensures that the site is designed in a logical order and hierarchy, not just random placements for everything.

The website is adaptable to every kind of device. It works well on different devices and screen sizes and this is really important because visitors can access the site from any device that they use, such as a smartphone, laptop, desktop or a tablet. The navigation menu and content layout is adaptable to smaller screen sizes, therefore making the site very usable.

The navigation bar is on top of the site in every page and the footer includes links to other pages also, making navigating around the site feels like home.

## 10. Legal considerations

The brief explicitly stated that no offensive, defamatory and foul language is tolerable and legally risky materials should not be used. This is all followed and everything on the site is positive, engaging and suitable for every age and people. The content is all fiction, no illegal materials are used on the site, as well as offensive language.

Additionally, the requirements also stated that personal information is not advised to be included, therefore the choice of using fictional names and details is adopted for the site.

Furthermore, all images are AI-generated and are not taken from any sources online and each image is reviewed carefully to avoid any legal consequences that might happen and make sure that all the images generated fits the project's context and no inappropriate images are generated.

## 11. Testing

The site is tested throughout the development to make sure that everything works in the correct way and smoothly before deployment. Everything that is checked before deployment are as follow:

- Links to pages work correctly and redirect to the right page
- Navigation bar highlights the page that the visitor is in
- Mobile menu
- Dark mode
- Gallery filters
- Lightbox feature for images
- Form validation and on-site response after submission (successful submission, missing information, invalid information)
- Layouts for different screen sizes

Content is also checked to make sure that everything is relevant to the project, the community and theme. Testing is important because in this phase, small errors can be found and fixed before deployment.

## 12. Strengths and weaknesses

| Strengths | Weaknesses |
|-----------|------------|
|-----------|------------|

|                                                                                                           |                                                           |
|-----------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|
| All pages covered the main sections for the community                                                     | Front-end shell only, so no backend information is stored |
| Consistent design language with little variations to avoid monochromatic design language                  | Static content                                            |
| Images and interactive features are implemented effectively                                               | Typography issues for dark mode                           |
| Clearly communicates the purpose of the community and provide ways for visitors to get involved in events |                                                           |

### 13. Reflection

This project has helped improve the skills on how to create a multi-page website. In addition, proper content planning, consistent visual identity and JavaScript interactive features are the key improvements while creating the site for GreenHaven.

A valuable part of the project is about how important structure is for a website. Not only does the website need to look attractive, it also needs to guide the visitor clearly and make information easy to find. Navigation, spacing, headings and action buttons are all improved in the development phase of the site and they are as important as colours and images for a website, making them a valuable part in creating a website.

The focus must always be on the visitor, not only developers. Every page was designed with an user-friendly theme and every action is engaging to the visitor and provides answers to FAQs that they might have, therefore making the site feel more purposeful and realistic.

As a whole, the project has created opportunities for improvement in web-designing skills, providing a base for future improvements as the journey of web-design continues and a lot of experience is gained from this project, especially on understanding how a website for a community organisation should work.

### 14. Conclusion

In conclusion, the GreenHaven Community website has followed all the requirements of the coursework brief. A multi-page website is designed for a community organisation that clearly

explains its purpose, shows what they offer and an encouraging design to get people to join their activities.

The website has six pages in total and a consistent design language is used, with minor variations. Images are used to provide an insight of what the organisation and their activities look like and contact information is displayed clearly so that visitors can get in touch with the organisation. The outcome is a welcoming, friendly and a brightly designed functional organisational website.

Overall, the site makes GreenHaven an inclusive and active community organisation. It gives visitors a clear understanding about the organisation with a realistic feel combined with engagement.
